The syntax of navbars has changed a little bit from Bootstrap 3, what's new is that they are built with Flexbox behind the scene, which means we can move elements around using the Flexbox utilities we learned so far.

Other than that, Bootstrap 4 uses separate classes for .navs, .nav-items, and .nav-links instead of HTML-specific selectors such as .nav > li > a. now instead of setting up that special structure we have to work with these special classes.

Now we are going to see how we can use Flex utilities to move things around.

```
<div= "container">
     <h1 class= "text-center display-4">Navs+Flex</h1>
     class= "nav-item">
                <a class= "nav-link active" href= "#">Active</a>
          <a class= "nav-link" href= "#">Link</a>
          </pre
                <a class= "nav-link" href= "#">Link</a>
          <a class= "nav-link disabled" href= "#">Disabled</a>
          </div>
```

```
<div= "container">
    <h1 class= "text-center display-4">Navs+Flex</h1>
    <a class= "nav-link active" href= "#">Active</a>
        <a class= "nav-link" href= "#">Link</a>
        <a class= "nav-link" href= "#">Link</a>
        <a class= "nav-link disabled" href= "#">Disabled</a>
```

```
<nav class= "nav">

<a class= "nav-link active" href= "#">Active</a>
<a class= "nav-link" href= "#">Link</a>
<a class= "nav-link" href= "#">Link</a>
<a class= "nav-link disabled" href= "#">Disabled</a>
</nav>
</div>
```

```
Navs+Flex

Active Link Link Disabled

Active Link Link Disabled
```

On the Bootstrap 4 website its mentioned that nav are now built-in with Flexbox. What's that mean is that they have *display* set to Flex.

Notice that we did not have to mention display flex or d-flex before declaring the class justify-content-end because its already enabled by default on a nav, now if we were working with a div or something, we had to specify to make it flexbox by declaring d-flex. But Bootstrap 4 has already done that for us, when we declared the nav class, its already Flexbox enabled. So, we can move things around without declaring the display flex (d-flex) class.

```
<
```

```
<a class= "nav-link" href= "#">Link</a>

cli class= "nav-item">
<a class= "nav-link" href= "#">Link</a>

cli class= "nav-item">
<a class= "nav-item">
<a class= "nav-link disabled" href= "#">Disabled</a>

</div>
```

Active Link Link Disabled Active Link Link Disabled

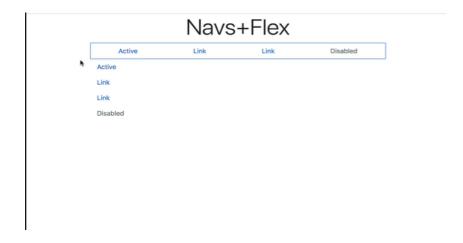

```
cli class= "nav-item">
<a class= "nav-link" href= "#">Link</a>
cli class= "nav-item">
<a class= "nav-link disabled" href= "#">Disabled</a>

</div>
Output
```

Navs+Flex Active Link Link Disabled Active Link Link Disabled

```
<nav class= "nav flex-column">

<a class= "nav-link active" href= "#">Active</a>
<a class= "nav-link" href= "#">Link</a>
<a class= "nav-link" href= "#">Link</a>
<a class= "nav-link disabled" href= "#">Disabled</a>
</nav>
```

Navs+Flex

Output:

Extra Small screen

Small screen

<nav class= "nav flex-column flex-sm-row justify-content-center align-items-center">

```
<a class= "nav-link active" href= "#">Active</a>
<a class= "nav-link" href= "#">Link</a>
<a class= "nav-link" href= "#">Link</a>
<a class= "nav-link disabled" href= "#">Disabled</a>
</nav>
```

Output:

Extra Small screen

On all other screens

Navs+Flex

Active Link				Link	Disabled
	Active	Link	Link	Disabled
